Synopsis

These tests can be used with the new entrant or nonreader because the child is asked to help the examiner by pointing to certain features as the examiner reads. An Observation Survey presents the theoretical background, administration details, and scoring interpretation of the tests. Sand is a favourite diagnostic tool of reading teachers, and Stones was developed as an alternative. --This text refers to an alternate Paperback edition.

Customer Reviews

This book is designed for use with an observation survey determining a child's reading readiness and his/her concepts about print. Some pages have the words in strange order, some pages are upside-down, and so on, although superficially it looks like a "normal" book. It is illustrated and has big type, the illustrations facing the type pages. In line with the California Reading Initiative and the assembly bills requiring informed diagnosis of children's reading readiness and progress, and multiple assessments thereof, this is a valuable diagnostic tool for children entering school, to be used with the test script on page 47-48 of Marie Clay's An Observation Survey of Early Literacy Achievement.

I bought this book for students in reading recovery but I also used it for other students including gifted students. It is amazing how the children use it differently and get a different perspective on them according to their level Great tool!!!

I love this story as well as the other Marie Clay stories to assess a student's concepts of print. My students found the assessment fun, and I found it easy to use and informative.

I love the book for the content. I don't love it for the backing (paper). I could have printed it off myself for the same quality.
